Chapter 17

Biomedical Waste management rules 2016

IMPORTANT Questions

Q1. Describe Brief note on Biomedical Waste Management rules 2016.

Ans.

- Biomedical waste refers to any waste generated during the diagnosis, treatment, or immunization of humans or animals or research activities pertaining thereto or in the production or testing of biological products. Proper management of biomedical waste is crucial to protect the environment and prevent the spread of infections.
- The Biomedical Waste Management Rules 2016 are a set of regulations that provide guidance on the safe handling, segregation, transportation, and disposal of biomedical waste. These rules are applicable to all persons who generate, collect, store, transport, treat, dispose of or handle biomedical waste in any form.

Basic Aspects of Biomedical Waste Management Rules 2016

- **Segregation** : Biomedical waste should be segregated at the point of generation into different color-coded containers as per the type of waste. For example, yellow for anatomical waste, red for infectious waste, blue for glassware, and white for waste sharps.
- **Storage** : Biomedical waste should be stored in leak-proof and puncture-resistant containers that are properly labeled and securely fastened. The containers should be kept in a separate area designated for biomedical waste storage.
- **Transportation** : Biomedical waste should be transported in closed vehicles with appropriate markings indicating the type of waste being transported.
- **Treatment and Disposal** : Biomedical waste should be treated and disposed of in an environmentally sound manner as per the guidelines provided in the rules. The treatment and disposal methods may include autoclaving, incineration, microwave treatment, chemical disinfection, or any other method approved by the regulatory authority.
